ITA0328 - Mobile computing

Interdependencies

Contribution of each subsystem

Subsystem	Contribution
MS	* Initiates and receive calls * Sends/receive radio signals
BSS	* maintain radio connectivity * Allocates channel
NSS	* Routes calls and data * Manages subscriber records * Enables inter-network service

Which subsystem has greatest influence?

BSS has the greatest direct influence on service continuity.

* Maintains the radio link between MS and network
* Manages radio channels and handover through BSC.
* If handover fails, calls may drop even if MS and NSS are working.

conclusion

. MS ↔ BSS ↔ NSS
↓
seamless communication

The BSS has greatest direct influence, but uninterrupted service is possible only when all the subsystem operate together.
